89923k Configuration inversion of meso-dibenzylaminosuccinic acid. Mikhno, S. D.; Kulachkina, N. S.; Berezovskii, V. M. (Vses. Nauch.-Issled. Vitamin. Inst., Moscow). *Zh. Org. Khim.* 1970, 6(1), 81-4 (Russ.). The reaction of  $\text{ClCO}_2\text{Et}$  with mesodibenzylaminosuccinic acid (I) in the presence of  $\text{Na}_2\text{CO}_3$  at  $-5^\circ$  gave 5.5:1 mixt. of *D,L*-*N*-carbethoxydibenzylaminosuccinic acid (II) and bis(*N*-carbethoxybenzylamino)succinic acid (III). The reaction of  $\text{SOCl}_2$  with II gave II anhydride (IV) which was converted by heating at  $200^\circ$  into *trans*-4,5-dicarboxy-*N,N'*-dibenzyl-2-imidazolidinone anhydride (V). Heating II or III at  $200^\circ$  also gave V. The hydrolysis of IV gave II. Thus, the inversion of configuration occurs during the reaction of I with  $\text{ClCO}_2\text{Et}$ . The resolution of II with L-(+)-*threo*-1-(*p*-nitrophenyl)-2-amino-1,3-propandiol sulfate gave (+)-*threo*-II analog acid (-)-*threo*-II analog. The configuration of V was shown by comparison with the known *cis*-V isomer (U.S. 2,480,232, 1951). Heating V gave *trans*-4,5-dicarboxy-*N,N'*-dibenzyl-2-imidazolidinone monobenzamide. CPJR

 $P^4$ -(adenosine-5')tetraphosphate"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 2, Feb 70, pp 470-474

Abstract: The authors undertook to synthesize unsymmetrical dinucleo-  
side polyphosphates in the flavin dinucleotide series for purposes of  
ascertaining the effect of the length of the phosphoanhydride chain  
connecting the flavin and adenylic parts of the molecule on its abili-  
ty to recombine with the specific apoenzyme into the corresponding en-  
zyme.  $P^1$ -(Riboflavin-5')- $P^3$ -(adenosine-5')triphosphate and  $P^1$ -(ribo-  
flavin-5')- $P^4$ -(adenosine-5')tetraphosphate were synthesized from bis-  
4-morpholine-N,N'-dicyclonexylcarboxamidinium salt of adenosine-5'-  
diphosphate morpholide and tri-n.-octylammonium salts of riboflavin-

5'-mono- and riboflavin-5'-diphosphates respectively. It is shown  
that an increase in the length of the phosphoanhydride chain in the  
flavin adenine dinucleotide molecule brings about a decrease in the  
activity of these compounds as cofactors of D-amino acid oxidase as  
compared with flavin adenine dinucleotide.

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 4, Apr 70, pp 918-923

Abstract: Continuing their work on the chemistry of asymmetrically constructed pyrophosphates of the nucleotide coenzyme type, the authors synthesized NAD by condensation of nicotinamide mononucleotide (NMN) with adenosine-5'-phosphomorpholide in a solution of anhydrous dimethyl sulfoxide or in a mixture of anhydrous pyridine and dimethyl-formamide (2 : 1), as well as by condensation of NMN with adenosine-5'-monophosphate in a trifluoroacetic anhydride medium or in the presence of di-p-tolylcarbodiimide in aqueous pyridine. Thiamine nicotinamide nucleoside diphosphate (TNDP) and flavin nicotinamide dinucleotide (FND) were synthesized by condensation of NMN with thiamine

"Coefficients of Nonlinear Polarization of Proustite and Tellurium"

Moscow, Kvantovaya Elektronika, Sbornik Statey, No 2(8), 1972,  
pp 105-107

**Abstract:** Measurements are made of the effective coefficients of nonlinear polarization  $d_{21} \sin \theta_m + d_{22} \cos \theta_m$  with pumping propagation in the positive crystallographic quadrant, and the coefficient of nonlinear polarization of tellurium  $d_{11}$  with regard to the width of the pumping spectrum (10.6  $\mu\text{m}$ ). Pumping was done by a CO<sub>2</sub> laser in single-mode operation with Q-switching. The authors thank S. S. Shalyt and I. I. Farbshteyn for furnishing the high-quality tellurium specimens. Bibliography of twelve titles.

V sb. Vopr. teplofiz. vydern. reaktorov (Problems in the Thermal Physics  
of Nuclear Reactors--collection of works), vyp. 3, Moscow, Atomizdat,  
1971, pp 93-100 (from RZh-Elekrotekhnika i Energetika, No 9, Sep 71,  
Abstract No 9U188)

Translation: The authors discuss the use of an infrared CO<sub>2</sub>-N<sub>2</sub>-He laser  
with a wavelength of 10.6 μ. The parameters of laser emission enabled  
focusing on a fairly small area (~0.001 mm<sup>2</sup>), thus improving the reso-  
lution of thermal devices. A laser beam with a power of 6 W in the con-  
tinuous mode was used to detect flaws (pits in the casing and peeling  
of the fuel in nuclear fuel elements). Peeling in the form of a spot of  
arbitrary shape with a concentrated heat source is considered. The tem-  
perature of the casing rises when the laser beam hits a region where  
there is peeling. A pickup determines the temperature rise. It is found

Moscow, Atomizdat, 1971, pp 93-100

that an increase in the rate of beam displacement entails an increase in the required power of the source, a rise in maximum temperature and more severe requirements for the time lag of the temperature pickup. Emission from a laser with a power of 1 kW was focused by a field of  $3 \cdot 10^5$  W/cm<sup>2</sup> on an area of  $2 \cdot 10^{-3}$  mm<sup>2</sup>. Three illustrations, two tables, bibliography of five titles. A. M. Bovshovskiy.

Translation: Utilization of a CO<sub>2</sub>-N<sub>2</sub>-He gas infrared laser with a wavelength of 10.6 microns is discussed. The parameters of the laser radiation permitted focusing of it on a sufficiently small area (~ 0.001 mm<sup>2</sup>) and, at the same time, increasing the resolution of the thermal devices. A 6 watt laser beam was used to detect defects (holes in the jacket, exfoliation of the fuel). Exfoliation in the form of a spot of arbitrary shape with a concentrated heat source is investigated. When the laser beam hits the exfoliation region, the jacket temperature rises. The rise in temperature is recorded by a sensor. It is established that with an increase in the beam displacement rate, the necessary power supply increases, the maximum temperature increases, and the requirements on the inertia of the temperature sensor increases. Focusing one kilowatt

Cybernetics -- philosophical problems

Article by Academician A. I. BERG, full doctor of Philosophical Sciences, Dr. Ia. RUDNITSKAYA, Candidate of Philosophical Sciences, Institute of Philosophy, Siberian Branch, Russian Academy of Sciences, Novosibirsk, Vol. 4, No. 2, September 1971, pp. 45-51]

SPRS 5492  
23G Nov 1971  
USSR : 516.95

Cybernetics and philosophical methods... The development of the "standardized" or systematical approach has led to a need for systematic study of the processes of control and perception connected with them. The science of control and data processing has already gone through the embryonic period in which it was of purely academic interest to a narrow circle of initiates. Today it is becoming a very important factor in the contemporary scientific and technical revolution, exerting a considerable influence on scientific investigations, on various branches of social production and its organization, on science, in turn, put at the disposal of cybernetics increasingly powerful theoretical and engineering means.

Fundamental discoveries and achievements in the area of cybernetics require thorough philosophical investigation. The field of methodological and philosophical analysis is broad, especially as a result of the complex character of the problem. For the solution of which, the science of control and data processing, in addition to its own program of philosophical investigation, can also profitably be combined with the disciplines of logic, mathematics, linguistics, etc. The tasks of combining disciplines in philosophy, however, are not always easy to perform.

Cybernetics has already obtained a broad methodological base, dialectical materialistic and constructivist, and to refine the center of gravity has now been shifted to the study of concrete

104301b Evaluating the activity of an aluminosilicate cracking catalyst. Sokolova, V. I.; Berg, G. A.; Morozov, B. F. (USSR). Khim. Tekhnol. Topl. Masel 1970, 15(1), 17-21 (Russ). H as gas-carrier was satd. with isoctane (I) or other raw material, heated, and fed into the reactor contg. 1 g catalyst at 550°C and the reaction products entered a chromatog. column packed with 0.3-0.4 mm firebrick contg. 15% quinoline and analyzed. The catalyst activity was detd. in relation to the amt. of H converted expressed as wt. % yield of the reaction products, detd. 30 min after feeding raw material into the reactor at space velocity 0.04-0.0035 hr<sup>-1</sup>, remaining const. for another 2 hr. The relation between the conversion of I and activity coeff. of the catalyst was linear. The content of C<sub>3</sub>H<sub>6</sub>, obtained from secondary reactions, and butylenes as main reaction products depended on the sp. surface of the catalyst also, detg. its selectivity. The relation between the selectivity detd. as above and the ratio of gasoline to coke yields was linear. The method was also used for detg. the effect of various impurities of the raw material and metal impurities of the catalyst on its activity and selectivity. Characteristics of various catalysts and results obtained are tabulated. The app. and exptl. results are graphically presented.

"Method of Manufacturing Matrices"

USSR Author's Certificate No 273282, Filed 27/10/69, Published 14/09/70  
(Translated from Referativnyy Zhurnal Avtomatika, Telemekhanika i  
Vychislitel'naya Tekhnika, No 5, 1971, Abstract No 5B290P)

Translation: In a well-known method of manufacturing magnetic multiple-aperture memory element matrices for memory units holes are cut partially through a ferrite plate using a special tool on an ultrasonic machine. Then a layer of material is ground off of the backside of the plate until the holes open clear through. This produces all necessary holes in the plate. After this, the control windings are produced on the plate by photographic printing methods in the form of printed conductors passing through the apertures in the plate. The method of producing memory element matrices based on multiple-aperture ferrite plates has the following defects: impossibility of magnetic isolation of neighboring elements on the multiple-aperture plate, which makes it difficult to increase the density of information and force the switching mode of elements in order to increase speed; difficulty of producing thin multiple-aperture ferrite plates due to their 1/2

USSR

TSOGOYEV, T. K., and BERG, I. V., USSR Author's Certificate No 273282,

Abstract No 5B290P)

low mechanical strength (low plate thickness is necessary in order to decrease the inductance of the control leads on the matrix). The method suggested does not have these shortcomings and allows a matrix to be produced of magnetically isolated memory elements in the form of thin multiple-aperture cores with printed control windings. The purpose of the invention is to increase the density of information and the speed of magnetic memory elements. This is achieved by making notches in the plate in addition to the partial holes. The plate is then glued to a dielectric substrate on the side which carries the holes and slots, and the printed control conductors are applied, after which the opposite side of the plate is ground away until the slots and holes in which the ends of the conductors are located are opened. The ends of the conductors are contacted by printed conductors, forming the control wires passing through the apertures of the memory element plate. 1 fig.

"Parasitic Parameters of a Diode-Magnetic Decoder"

Elektron. Tekhnika. Nauch. - Tekhn. Sb. Microelektronika [Electronic Technology. Scientific-Technical Collection. Microelectronics], No. 5 (26), 1970, pp 90-97. (Translated from Referativnyy Zhurnal Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No. 5, 1971, Abstract No. 5b143 by TR).

Translation: One source of noise in the output circuits of memory units is the address current decoder of the magnetic operative memory. This property becomes stronger as accumulators are miniaturized. The mechanism of formation of noise in a diode-magnetic decoder is studied. It is demonstrated on the basis of analysis of the decoder matrix and the parasitic capacitances of its elements that the parasitic parameters of the decoder are described by a set of 6 equivalent capacitances. 4 figs.

"New Special-Purpose Electrodes"

Moscow, Svarochnoye Proizvodstvo, No 10, Oct 70, pp 54-55

**Abstract:** The Moscow Experimental Welding Plant has developed several new types of special-purpose electrodes. This article presents brief descriptions of the electrodes, which have passed industrial testing. The OZL-21 electrodes are recommended for welding equipment of nickel-chrome-moly corrosion-resistant alloys (such as Hastelloy S) to be used in acetic acid and other corrosive media. The OZL-25 electrodes are recommended for welding thin-sheet structures (8 mm or less) and heating elements of the KhN78T alloy. Type MNCH-2 electrodes are recommended for the correction of casting defects, and for surfacing of parts of gray, malleable, and high-strength cast iron without heating. OZR-1 electrodes are recommended for cutting and piercing of products of steel (including stainless steel), cast iron, and copper, and OZI-3 electrodes are recommended to replace type OZI-1 electrodes for reinforcement surfacing of hot- and cold-deformed metals, cutting tools, and fast-wearing machine parts.

"Synthesis of Phosphatidic Diols"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 1, Jan 71,  
pp 194-196

**Abstract:** The synthesis of phosphatidic diols (I) is based on the condensation of the silver salt of benzyl-(1-lauroyl-2-oleoyl-sn-glyceryl) phosphate with trityl ethers of glycol iodohydrines. Removal of the benzyl group from the thiophosphates with sodium iodide in acetone followed by removal of the trityl group by acid hydrolysis yielded 1-lauroyl-2-oleoyl-sn-glycero-3-phosphorylethylene glycol, 1-lauroyl-2-oleoyl-sn-glycero-3-phosphorylpropanediol, and 1-lauroyl-2-oleoyl-sn-glycero-3-phosphorylbutanediol. The phosphatidic diols obtained are soluble in most common organic solvents and can be stored in the form of calcium salts.

"The Usefulness of Electroslag Remelting in the National Economy"

Dnepropetrovsk, Metallurgicheskaya i Gornorudnaya Promyshlennost', No 4(82)  
Jul-Aug 73, pp 66-68

**Abstract:** Results are presented of an investigation of the economic impact of the introduction of the electroslag remelting (ESR) process. The economic effect is seen as the algebraic sum of expenditures for the production and utilization of the metal. The use of electroslag metal in the production of responsible bearings reduces waste in metal processing and prolongs the life of bearings by a factor of 2-3 and results in an economy of up to 5319 rubles/ton. The economy resulting from introducing EI961 heat-resistant steel in the production of compressor disks is 1849 rubles/ton. The introduction of 40KhNMA steel for the production of longerons produces savings of 6200 rubles/ton, while the introduction of 1Kh17N2 stainless steel for production of turbine blades results in savings of 13,250 rubles/ton.

"Technical Realization of Final Radar Station Devices"

Kiev, Izvestiya VUZ SSSR--Radioelektronika, No 6, 1972, pp 712-716

Abstract: Noting that the practical realization of digital systems for processing radar information presents many problems that have as yet not been fully solved, the authors consider devices for detecting and estimating target azimuth. The method to be used by these devices is that of maximum probability in binary amplitude quantization of the radar pulse signals scanning through a single angular coordinate, the azimuth, in a symmetrical beam with constant velocity. The distance to the target is considered known. The authors begin their analysis by considering an algorithm in accordance with which the device for detection and estimation of the target and its azimuth in binary weight processing of the signals should act. This algorithm is rewritten in the form of two equations for the weighted sum, representing the measured azimuth, and the block diagram of a digital device for realizing this rewritten algorithm and computing the target azimuth is shown. The authors note that the device is made of standard digital elements and can easily be readjusted for changes in azimuth detection and computation criteria. A variation of this device is also shown.

"Hyperbaric Oxygenation Principles of Use. Indications. Regimes"

Moscow, Eksperimental'naya Khirurgiya i Anesteziologiya, Vol 15, No 3, May/Jun 70,  
pp 52-62

Abstract: Available data on hyperbaric oxygenation in hypoxia and cardiovascular surgery are reviewed. Application of hyperbaric oxygenation in cardiovascular surgery is considered from two points of view: 1) the possibility of application in combination with hypothermia for temporary exclusion of the heart from circulation, and 2) use in surgery of congenital heart defects of the blue type. In 38 experiments conducted on dogs at the Institute imeni Bakulev, hyperbaric oxygenation was applied for 60-80 min in a pressure chamber at an air pressure of 3.5 atm, while the body temperature was lowered to 16-20°C by using artificial circulation bypassing the heart. Artificial respiration was used. Circulation was interrupted for 60 min. Hypothermia eliminated hyperbaric vascular spasms. Fibrillation of the ventricles during restoration of cardiac activity was stopped by injection of 1-1.5 g KCl in solution. As shown by the EEG, the brain activity was not impaired. Hyperbaric oxygenation was also applied in experiments on dogs in which a blue

defect was artificially created by establishing a venous-arterial shunt. The principles of hyperbaric oxygenation by increasing air pressure are well known; the problem is determining the optimum conditions for its application. A differential equation is proposed by means of which the  $O_2$  concentration in arterial and venous blood under various conditions of hyperbaric oxygenation can be determined in relation to the body weight, per minute volume of the blood, arterio-venous difference, and the size of the right-to-left shunt.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE PAPER IS DEVOTED TO THE PRESENT DAY DATA OF HYPERBARIC OXYGENATION. PRINCIPLES, INDICATIONS AND OPTIMUM REGIMES OF THE METHOD IN CARDIO VASCULAR SURGERY ARE GIVEN. HYPERBARIC OXYGENATION IN CARDIO SURGERY IS CONSIDERED IN TWO SEPARATE PROBLEMS: 1) COMBINED USE OF HYPERBARIC OXYGENATION AND DEEP HYPOTHERMIA, 2) POSSIBILITIES OF USE OF HYPERBARIC OXYGENATION IN THE SURGERY OF CONGENITAL HEART DEFECTS OF THE BLUE TYPE. COMBINED USE OF HYPOTHERMIA AND HYPERBARIC OXYGENATION PERMITS TO INCREASE THE EFFECT OF EACH SINGLE FACTOR. INDICATIONS FOR DEEP HYPOTHERMIA ARE THUS INCREASED. TO STUDY THE EFFECT OF HYPERBARIC OXYGENATION IN UNCORRECTED HYPOXIA IN ANIMALS CARDIAC DEFECT OF THE BLUE TYPE WAS CREATED ARTIFICIALLY. DATA OBTAINED PERMITTED TO ELICIT THE MAIN TRENDS OF OXYGEN SATURATION. A NEW MATHEMATICAL MODEL OF SATURATION UNDER HIGH PRESSURE WAS SUGGESTED. PRACTICAL RECOMMENDATIONS AS TO CHANGES IN THE ACID BASE BALANCE UNDER HIGH OXYGEN TENSION WITH THE RIGHT TO LEFT SHUNT ARE GIVEN.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE AUTHORS ANALYZE THE CLINICAL AND EEG DATA IN 40 PATIENTS WITH CHRONIC ALCOHOLISM AND EPILEPTIFORM SYNDROMES AND IN 10 ALCOHOLICS WITHOUT SEIZURES. IT WAS POSSIBLE TO ESTABLISH 3 MAIN TYPES OF EEG CHANGES: 1) RELATED TO TOXIC ENCEPHALITIS; 2) REFLECTING THE DYSFUNCTION OF DEEP MIDDLE BRAIN STRUCTURES; 3) CORTICAL FOCI IRRITATION. THE LATTER TYPE OF CHANGES WAS SEEN ONLY IN PATIENTS WITH CONVULSIVE SEIZURES. THE 2 FORMER GROUPS WERE CHARACTERIZED BY PATIENTS WITH ALCOHOLISM IN GENERAL.

"Ion-Exchange Properties of Sodium Hydroalumocarbonate"

Novosibirsk, Izvestiya Sibirskego Otdeleniya Akademii Nauk SSR -- Seriya  
Khimicheskikh Nauk, No 1, 1973, pp 88-92

Abstract: The results are presented from a study of the equilibrium distribution of cations ( $\text{Na}^+$  and  $\text{Ag}^+$ ) and the kinetics of the exchange process between sodium hydroalumocarbonate and  $\text{AgNO}_3$  solutions. The cation-exchange isotherm was determined at  $25^\circ\text{C}$  for  $\text{Na}_2\text{O}\cdot\text{Al}_2\text{O}_3\cdot2\text{CO}_2\cdot3\text{H}_2\text{O}$  and a mixture of sodium nitrate and silver nitrate solutions. With the ion fraction of silver in the equilibrium liquid phases equal to or greater than 0.1, the degree of substitution of  $\text{Ag}^+$  for  $\text{Na}^+$  in the equilibrium solid phases is 97-99.5%. The phases with variable  $\text{Na}^+$  and  $\text{Ag}^+$  content are members of a continuous series of solid solutions between the sodium and silver forms of hydroalumocarbonate. The limiting stage of the exchange is diffusion of the  $\text{Na}^+$  and  $\text{Ag}^+$  ions in the solid phase. The mutual diffusion coefficient of the indicated ions determined on the basis of the kinetic measurements  $D_{\text{Na},\text{Ag}} = 5.7 \cdot 10^{-6} \text{ cm}^2/\text{sec}$  agrees satisfactorily with the calculated value of  $-5.1 \cdot 10^{-6} \text{ cm}^2/\text{sec}$ .

"The Biopulse-2, an Apparatus for Auxiliary Blood Circulation"

Moscow, Meditsinskaya Tekhnika, No 4, 1971, pp 14-19

**Abstract:** The Biopulse-2 is an electromagnetic pump with bioelectric control designed to provide auxiliary blood circulation in different kinds of cardiac insufficiency in order to relieve the heart and increase the venous blood flow. The apparatus consists of a cardiac biopotential amplifier, control unit, power amplifier, motor with a pump, and power supply. The biopotential amplifier collects and processes biological information. The control unit regulates the pulsating current. The power amplifier boosts the pulsating current of low-power electrical energy while the electromagnetic motor with a diaphragm pump head transforms the electrical energy into mechanical energy to move the blood.

"Use of Ceramic Heat-Transfer Dielectrics in Ferrite Microwave Devices"

Moscow, Radiotekhnika, Vol. 26, No 5, May 71, pp 79-83

**Abstract:** This paper discusses the effect which filling a waveguide with beryllium oxide has on the electrodynamic parameters of a microwave device (losses, phase shift, etc.) as well as the thermal conditions of ferrite plates when beryllium oxide is used. The use of beryllium oxide in a discrete ferrite phase shifter is considered by way of example. Analysis shows the effectiveness of using heat-transfer ceramic dielectric in high-power microwave devices. The average operating power of a ferrite device can be considerably increased with no change in electrical characteristics when a heat-transfer dielectric is used.

BASIC FEATURES IN METALLOGENY OF NORTHEASTERN PART OF PACIFIC  
BELL (NORTHEAST CORDILLERS AND ALASKA)

Article by V.I. Berger and M.I. Tikhonov; Moscow, Sovzhetkaya Gidrologiya,  
Finland, No. 1, 1972, pp. 35-137.

One of the most effective methods for predicting the ore-bearing regions is the technique of analogies based on comparative metallogenic analysis. From this viewpoint, it is desirable to examine the features in the metallogenic development of the territory (outstanding in respect to its mineral resources) of Alaska and the Canadian Cordillers in the light of regional metallogenic concepts of the Soviet metallogenic school of thought. An analysis conducted on this territory—an important link in the Pacific metallogenic belt, noted by S.S. Shirnay [7]—will permit us to focus our attention on certain issues which can be utilized in predicting the ore-bearing regions in the West of the USSR.

At the basis of the article, we have placed literary sources and a map of British Columbia, Alaska and the Yukon Territory. We have also used numerous reports on individual types and groups of endogenic deposits, published in recent years (11, 12, 13, 14, 15, 16, 17, 18). Uniquely valuable material has been generalized in the collective "Geologic History and Mineral Deposits of the Western Cordillera" (Gamble, White, Ney, Armstrong and others) [25].

Based on analyzing all the published data, we have compiled regional metallogenic and other charts which are included in the present report.

The geological basis for those graphic representations has been provided by the "Geologic Map of North America" to a scale of 1:5,000,000 published by the U.S. Geological Survey in 1965 and compiled at the Institute of Arctic Geology; "Geologic Chart of Alaska, Southeast Alaska and Northeastern Part of Canada" on a scale of

BERGOL'TS, V., Doctor of Medical Sciences, Professor

"In Search of the Causative Agent of Disease"

Moscow, Nauka i Zhizn', No 9, Sep 70, pp 55-58

Abstract: A review is presented of research being conducted in the search for the agents of two forms of malignant neoplasms leukoses and sarcomas. Particular attention is devoted to the theory of the viral etiology of these diseases in man. The discovery of virus-induced leukoses in hens in 1908 and of sarcomas in 1911 prompted the development of worldwide research activities seeking to establish a definite connection between the presence of the viruses in human tissues affected by leukosis and sarcoma and the development of these diseases. The first experimental data pointing to the possibility of a virus being the causative agent of sarcomas in man were obtained in the Soviet Union in 1954, at the Laboratory of Academician L. M. Shabad of the Academy of Medical Sciences USSR, who established that filtrates of human sarcomatous tissues may induce the disease in experimental animals. The possibility of inducing sarcomas in animals by injections of filtrates obtained from sarcomatous human tissue was confirmed by experiments carried out by A. Ageyenko at the Laboratory of Professor

1/2

USSR

BERGOL'TS, V., Nauka i Zhizn', No 9, Sep 70, pp 55-58

V. Gorodilova at the Moscow Institute of Oncology imeni Mertzen and investigations conducted by the American Scientists D. Morton and his associates. Other experiments conducted at the Laboratory formerly headed by L. A. Zil'ber at the Moscow Institute of Oncology established the presence of non-cellular virus elements in human leukosis tissue. V. A. Lapin, a corresponding member of the Academy of Medical Sciences USSR working in the same institute, was able to induce leukosis-like diseases in primates by injecting filtrates obtained from human leukosis tissue into the animals. Using an electron microscope, Academician A. D. Timofeyevskiy and his associates at the Moscow Institute of Oncology detected virus-like bodies in human sarcomatous and leukosis tissues. It has thus been established that characteristic viruses are found in human tissues affected with leukoses and sarcomas. However, there is no absolute proof that these viruses definitely induce the development of the diseases. To clarify the role played by the viruses in inducing diseases in man, intensive studies are now being conducted in some zones of tropical Africa, where leukoses and sarcomas are encountered in children.

BERGOL'TS, V., M.D., Professor, Moscow Oncology Institute imeni P. A. Hertzen

"Has the Culprit Been Found?"

Moscow, Pravda, 22 Jan 70, p 6

Abstract: In response to readers' requests, the professor stated that viruses found in many malignancies are not contagious. In 1908-1911, Rous transmitted leukemia (leucosis) and sarcoma, both virus diseases, from diseased to healthy chickens. More than 20 varieties of virus responsible for leucosis and sarcoma in birds, mice, rats, and other animals are presently known. The virus is not very virulent, and may remain in the body for its entire life. Only in some definite disturbances of the organism and an increase in virus can disease be produced. There now is a vaccine which effectively prevents the development of leucosis in birds and mice. This is hopeful for similar control in man.

The first data on experiments with virus in the USSR appeared in medical literature in 1954. Filtrates from tissues of diseased

animals had produced sarcoma in healthy species. It was shown that these malignancies were activations of their own dormant virus, which was substantiated in the USA. The American researcher Morton showed the presence of antibodies which can neutralize antigens in sarcoma patients. Thus, virus in sarcoma has been found. But, is it the truly causative agent or merely a passenger? While much is not yet clear, there is a hopeful view for the future.

VIRAL HEMANGIOMATOSIS OF MICE

V. M. Bergofia  
Moscow P. A. Guertzen Oncological Institute

The paper describes a viral hemangiomatosis transplantable by cellular and acellular material on mice of CC57BR strain. This virus is, apparently, not identical with viruses of mice leukemia, viral sarcoma of Moloney and polyoma.

DISTINCTIVE FEATURES IN THE ULTRASTRUCTURE OF THE ANTERIOR PITUITARY LOBE OF NEONATE RATS

(Article by D.I. Beriashvili, Institute of Human Morphology, USSR Academy of Medical Sciences, Moscow, Moscow, Vsesoyuz Akademik Meditsinskikh Nauk SSSR, Russian, No 10, 1971, pp 48-52)

As we know, the anterior lobe of the hypophysis begins to function long before birth. There are a few reports about its ultrastructure in prenatal ontogeny (Dubois, Andreini et al.; Sano and Sasaki), but we failed to find any research dealing with investigation of the distinctive features in the ultrastructure of the cells of the anterior pituitary lobe of neonate rats. In the literature available to us, for this reason, there was a need to make an indepth investigation of the submicroscopic distinctions of the anterior pituitary lobe of neonate animals to enable us to assess with greater reliability the mechanisms of hormonogenesis and pituitary secretion.

The pituitaries of 16 neonate albino mongrel rats, of both sexes, served as the experimental material. It was fixed with glutaraldehyde then with osmium tetroxide. After conventional dehydration, the anterior pituitary lobe was imbedded in a mixture of araldite and epox by the method of Hollenauer.

We had previously observed (1970) that in essence the submicroscopic structure of the anterior hypophyseal lobe of neonate rats is the same as that of adult animals. Yet, there are several submicroscopic distinctions in the adenohypophysis of the neonate. All of the cellular elements inherent to the adult adenohypophysis are represented. The eosinotropic cells (Figure 1) are large and oval or slightly elongated. Their nuclei present irregular outlines. In them, chromatin is evenly distributed with negligible maturation. Golgi's complex and the endoplasmic reticulum are rather well developed. They are arranged in the form of tubes along the nucleoloma. There are many mitochondria that are round with a moderately electron dense matrix. They are 0.2-0.3 micron in size. The cellular cytoplasm contains many electron dense round secretory granules varying in size from 200 to 300 micrometers. There are more granules in the peripheral part of the cytoplasm than become less electron dense near the plasma membrane. In the cytoplasm there are free ribosomes; polyosomes are also encountered. Quite often multi vesicular corpuscles

"Investigating Multiple Scattering of Light"

Leningrad, Optika i Spektroskopiya, Vol 31, No 5, 1971, pp 788-795

Abstract: This article is the continuation of an earlier paper by the same authors in the same journal (28, 1970, p 504). The earlier paper represented research into the scattering of light in polystyrol latexes, in which data was obtained on the dependence of the multiple dispersed light intensity on the depth of the dispersing medium. The present article discusses the results of the experiments described in the first, which showed that if a parallel beam of light is normally incident on the base of a cylinder made of the dispersing material, the intensity of the scattered light dies away exponentially as a function of the depth. In the present article, the physical significance of one of the factors in the exponent, the attenuation factor of the repeatedly scattered light, is examined. A method is also proposed for the separate determination of  $\sigma$  and  $\alpha$ , the coefficients of light scattering and absorption respectively, which requires no new equipment except for a modification of the ordinary spectrophotometer.

"Investigation of the Scattering of Light in the Critical Region of Separation of Solutions"

V sb. Sovrem. probl. fiz. khimii (Modern Problems of Chemical Physics -- Collection of Works), Vol. 5, Moscow, Moscow University, 1970, pp 323-357 (from RZh-Fizika, No 7, Jul 71, Abstract No 7D929)

Translation: Studies concerning the measurement of extinction and the polar scattering diagram in the region of critical opalescence of separating solutions are surveyed. Particular attention is given to accounting for multiple scattering and to obtaining the correlation parameters with the introduction of the appropriate corrections. 73 ref. V. Z.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. LIGHT SCATTERING WAS STUDIED OF THE SYSTEM C SUB5 H SUB11 OHMENO SUB2 IN THE VICINITY OF THE CRIT. POINT WITH INCIDENT LIGHT OF 4050, 4360, 5460, AND 5780 ANGSTROM. THE RELATIVE SCATTERING INTENSITY AND THE DEGREE OF DEPOLARIZATION ARE STUDIED WITH 14 SCATTERING ANGLES BETWEEN 30 AND 140DEGREES. BECAUSE OF ALMOST IDENTICAL NS OF THE COMPONENTS, THE CRIT. OPALESCENCE IS NOT VERY STRONG, AND MULTIPLE SCATTERING DOES NOT INTERFERE WITH THE MEASUREMENTS. THE THERMOSTATING WAS REALIZED WITH AN ACCURACY OF PLUS OR MINUS 5 TIMES 10 PRIME NEGATIVE4 DEGREES.
